Prostate Cancer in the United Kingdom: An Ethnic Perspective

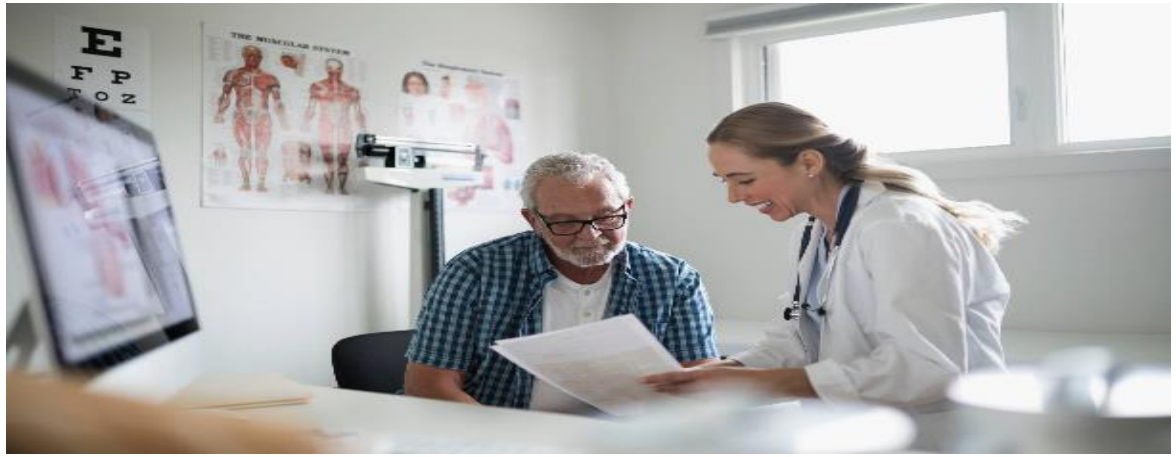
Analysis based on ONS data (21st March 2021 – 31st January 2023)

Oyelade Oke

Date: 2nd September 2025

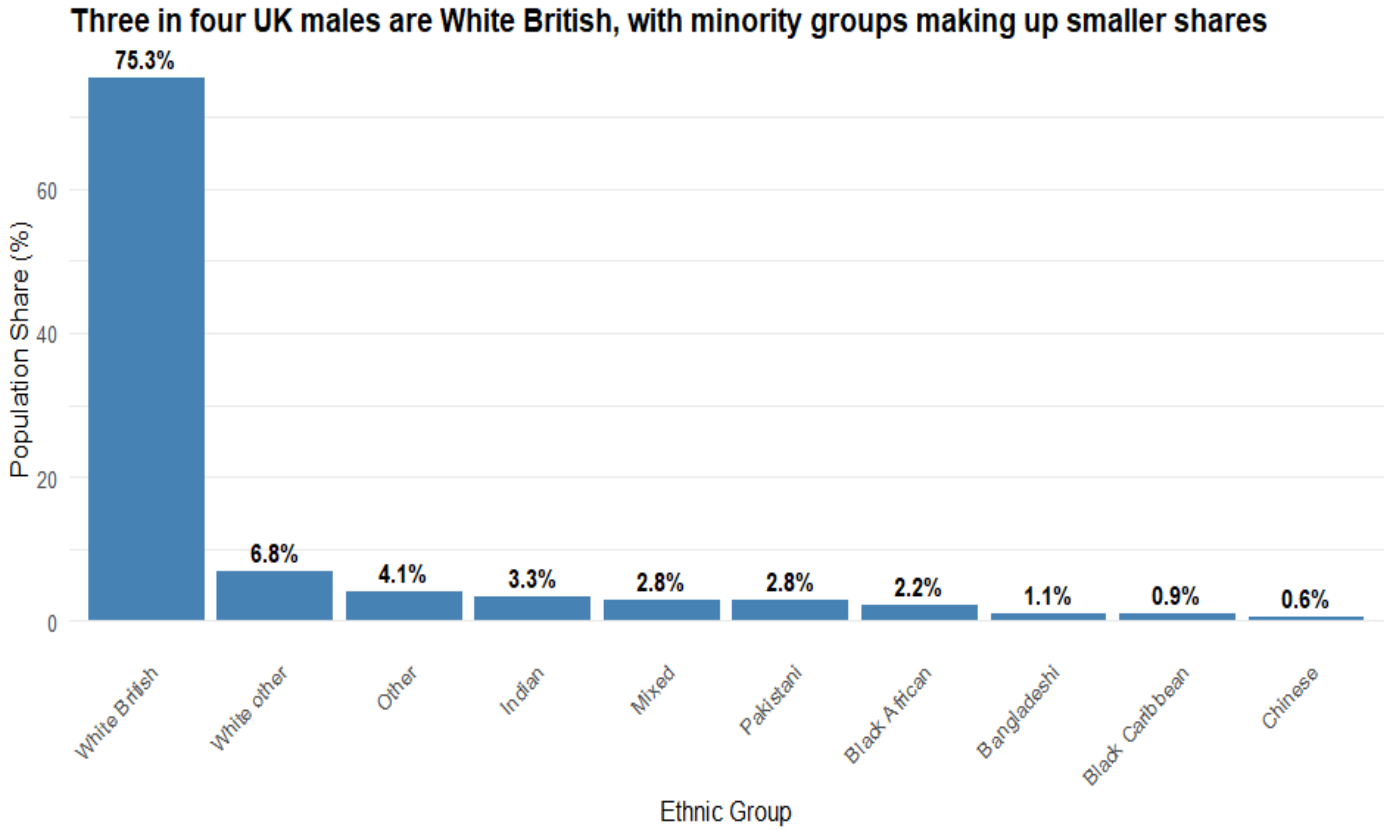
INTRODUCTION

Prostate cancer is the most common cancer among men in the UK. Investigating outcomes by ethnicity is crucial, as disparities may reflect genetic predispositions lifestyle factors, and differences in access to care, ensuring that all groups receive equitable treatment.



How is the male population in the UK distributed across ethnic groups?

*Most of the UK male population is **White British,** accounting for **75.3%** of the entire male population …*

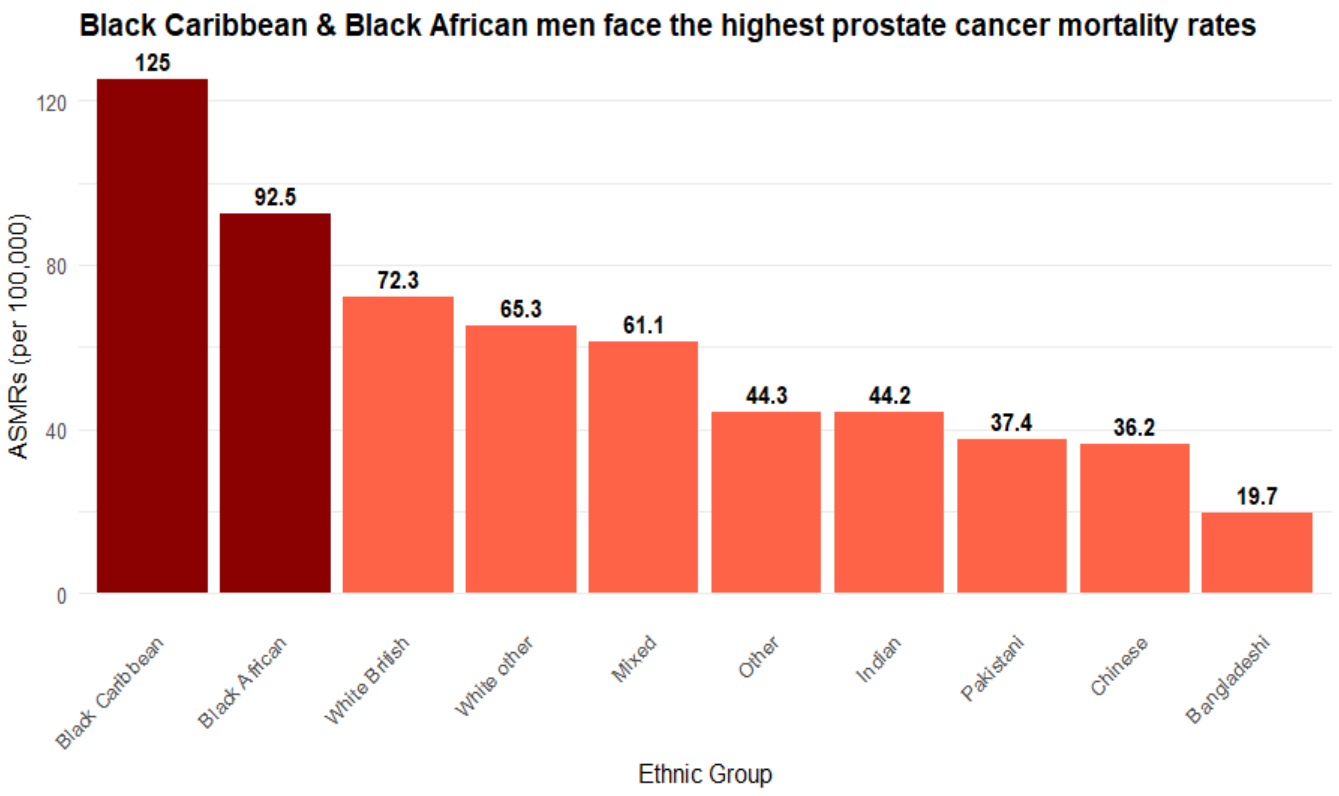


How does Prostate Cancer mortality vary across UK ethnic groups?

(Using Age-Standardised Mortality Rates (ASMRs) per 100,000 to ensure fairness across age groups)

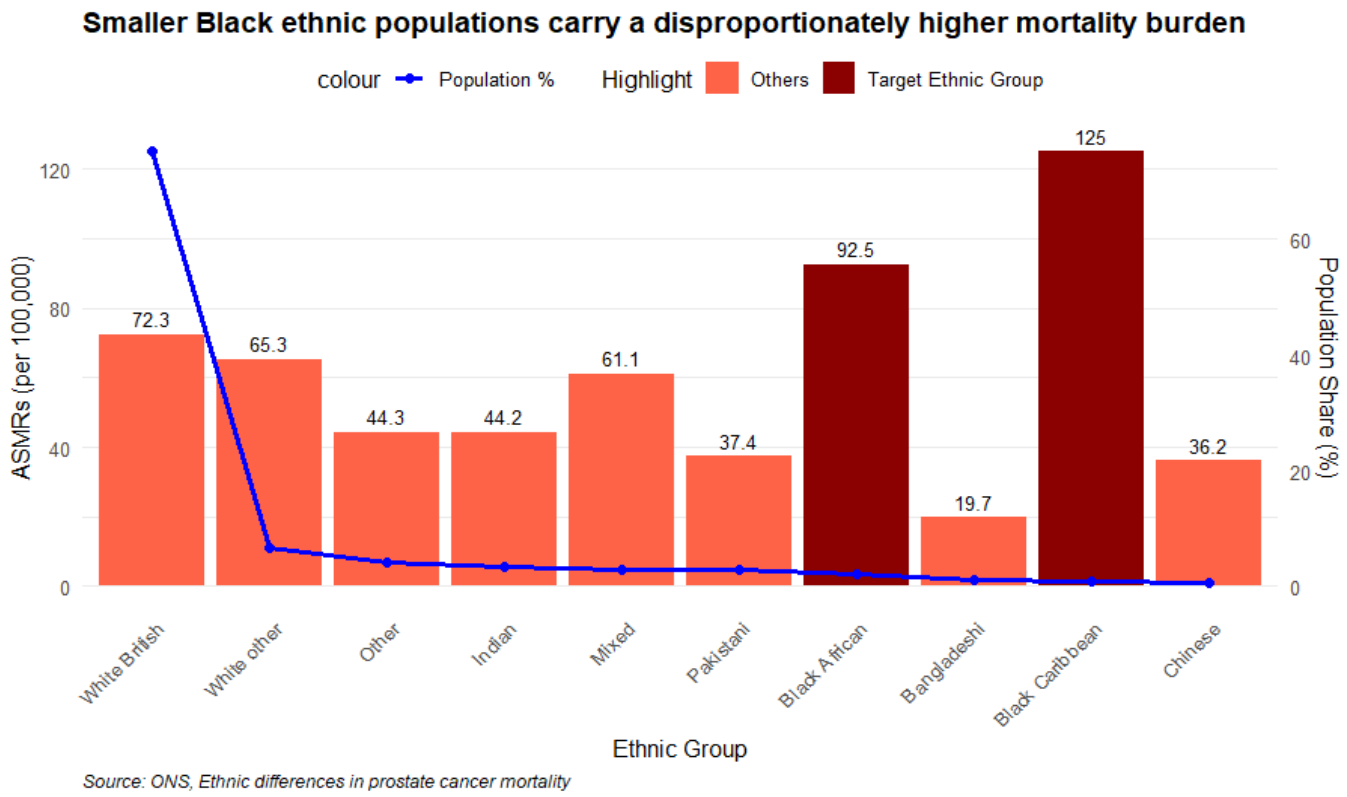
***ASMRs** per 100,000 measures how many deaths will occur if 100,000 men were followed over a year.*

*Despite having smaller population – **Black Caribbean & Black African** males have higher age-standardised mortality rates of **125** & **92.5** per 100,000) compared to other ethnic groups.*

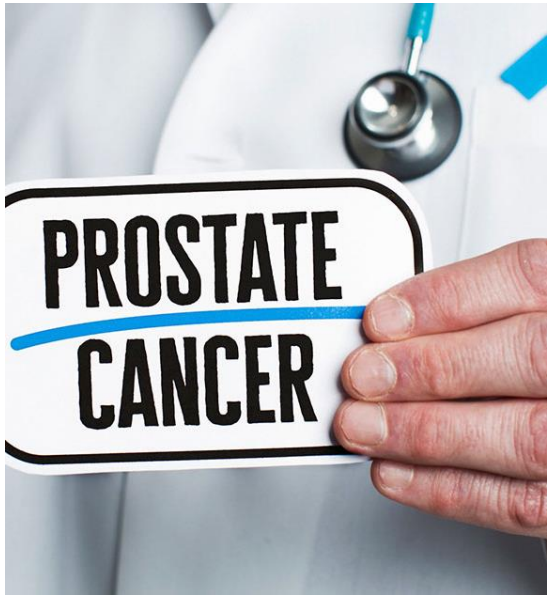


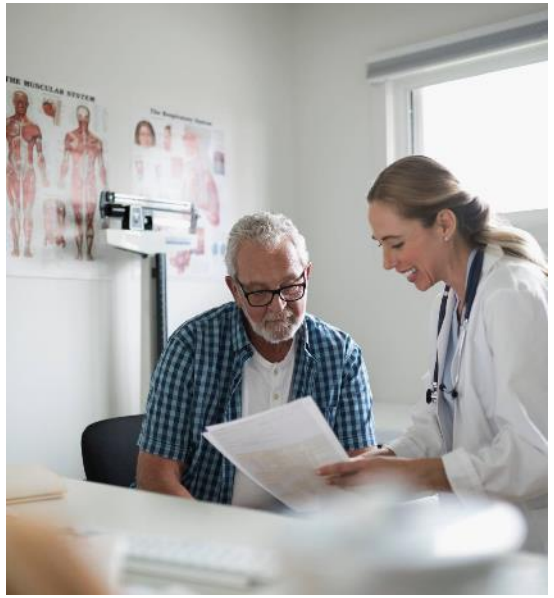
Black Caribbean & African men face the highest mortality burden

"Despite being only 0.9% and 2.2% of the population, their mortality is the highest"



Source: ONS, Ethnic differences in prostate cancer mortality





IMPLICATIONS:

- *Targeted awareness and early screening for high-risk groups.*
- *Supports NHS strategy to reduce ethnic health inequalities.*

"Ethnicity shapes prostate cancer outcomes – acting early can make the difference."
